DETAILED ACTION

Allowable Subject Matter

1. Claims 1-11, 13-17, and 18 are allowed.
2. The following is an examiner's statement of reasons for allowance:

As for claim 1, the prior art reference to Griffiths (6262776) teaches a data source for compressed audio and video digital data, where the bit positions for the audio or video data are collected together in several connected component bit groups, the data source including: a demultiplexer to separate the compressed audio and compressed video data in one compressed signal, a bit stream decoder that decodes the separated audio data to provide decompressed audio data, an audio buffer for intermediately storing the decompressed audio data and providing buffered decompressed audio data, a video buffer for intermediately storing the recoded video data, and a control unit that is connected to the audio buffer and the video buffer, and which specifies and controls the adjustable intermediate storage time of the buffers. The prior art reference to Sebestyen (6236805) teaches a bus interface that inserts the audio data and the video data into their corresponding component bit groups. The prior art fails to teach a bit rate converter to selectively recode the compressed video data in response to a bit rate control signal to provide recoded video data, a bus interface that receives a data sink video characteristic signal and provides a received data sink video characteristic signal, and a control unit that in response to the received data sink characteristics signal provides the bit rate control signal.

As for claim 13, the prior art reference to Griffiths (6262776) teaches where a component of the network transmits audio digital data and compressed digital video data where the bit positions for the audio or video data are collected together in several connected component bit groups, where the subscriber data source includes a demultiplexer that separates compressed audio data and compressed video data contained in one compressed source signal and a pre-processing circuit that processes in parallel the separated audio data and the separated video data to provide decompressed audio data and the compressed video data. The prior art to Roppel teaches subscriber data source that transmits data to respective subscriber sinks on a network. The prior art fails to teach where a control unit receives a data sink video characteristic signal and provides a received data sink video characteristics signal to a video bit stream converter that processes the compressed video signal in accordance with the data sink video characteristics signal to reduce the bit rate of the compressed video signal and provide a reduced bit rate video signal, where the reduced bit rate video signal and the decompressed audio signal are output to a data sink on the network.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
